The 14th BSRN Scientific Review and Workshop
26-29 April, 2016 Canberra, Australia

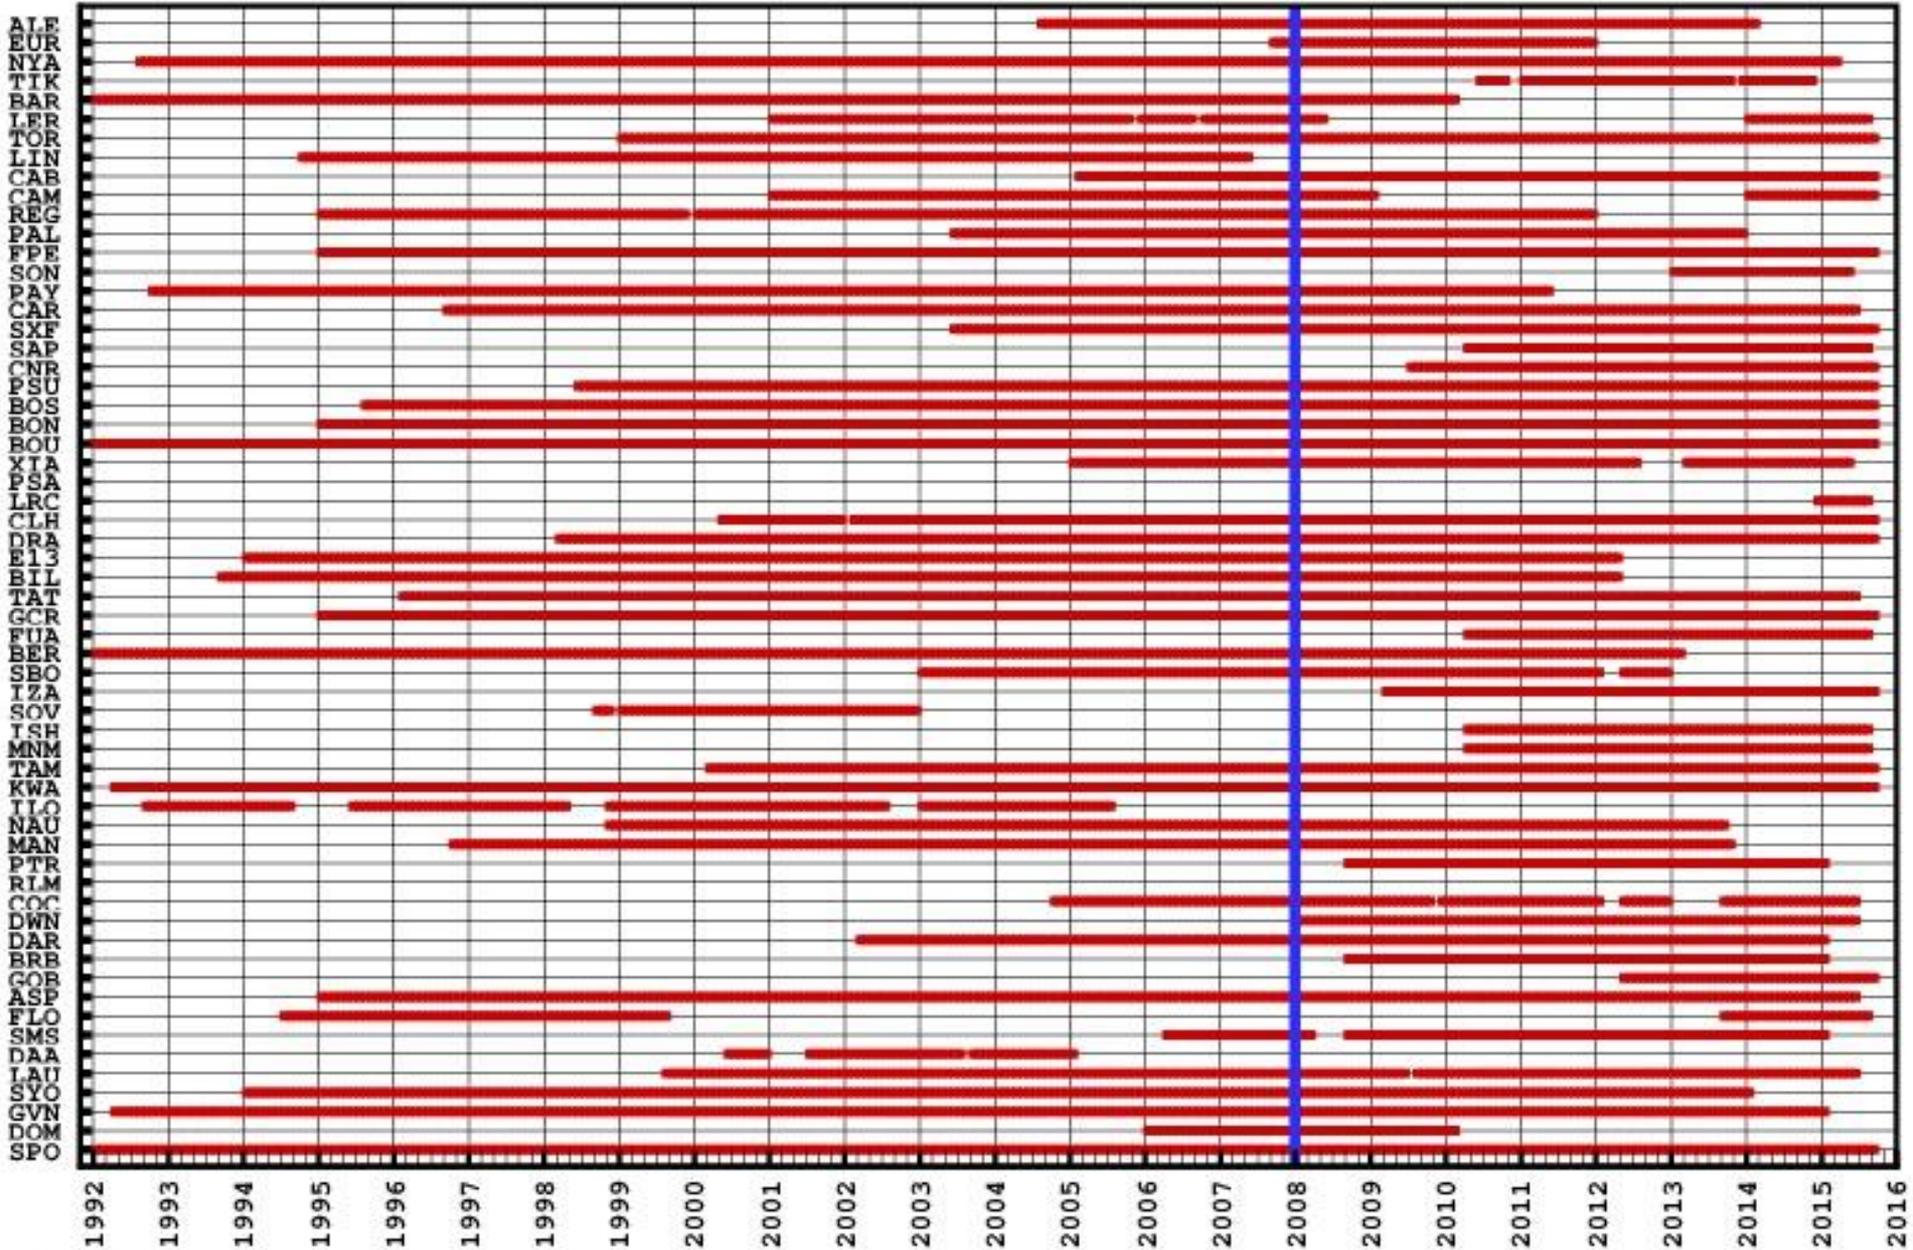

Outline of the Presentation ...

- The BSRN data available as of 2015-10
- Generating the *3-hourly*, *3-hourly-monthly*, *daily* and *monthly* means
- Validating the GEWEX SRB and FLASHFlux **GHI** and POWER SSE **DNI** data against the BSRN data
- Summary and conclusions

BSRN sites as of 2015-10

8955 Available Site-Months of BSRN Data as of 2015-10-27

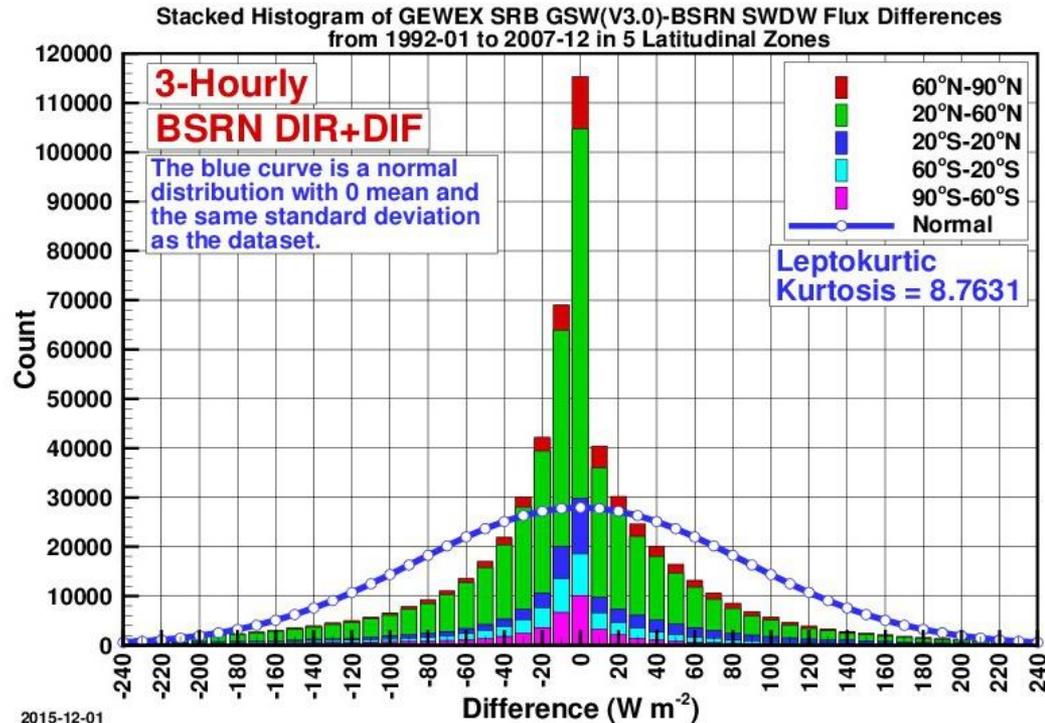

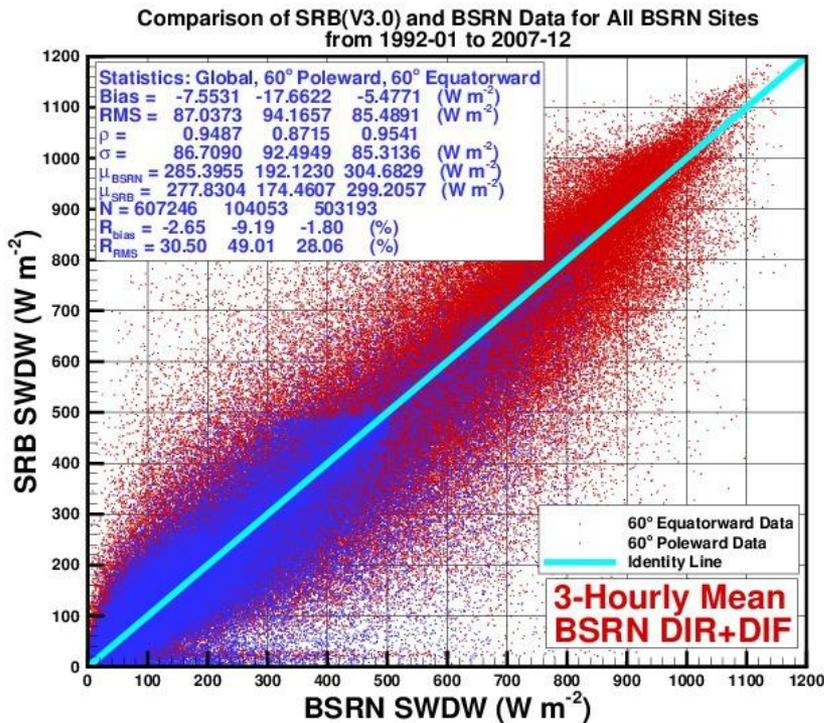

Flow Chart of Averaging the BSRN Data on Various Time Scales

Validating the GEWEX SRB* *Global Horizontal Irradiance (GHI)* **against the BSRN Data:** **1992 - 2007**

- * GEWEX SRB Rel. 3.0 provides total shortwave downward fluxes, among other things, at the Earth's surface at 3-hourly, 3-hourly-monthly, daily and monthly time scales and quasi-equal-area $1^\circ \times 1^\circ$ resolution from 1983-07 to 2007-12;
- * Rel. 4.0 products with new algorithm and inputs are in progress

Validating the Model-Derived *Direct Normal Irradiance (DNI) against the BSRN Data: 1992 - 2007**

- * The DNI 3-hourly, daily and monthly means are produced using the DirIndex model, a global-to-beam model, with the GEWEX SRB Rel. 3.0 all-sky and clear-sky GHI as inputs; other inputs include the MERRA atmospheric meteorology and daily mean aerosol optical depth derived from MAC-v1;
- * The data are available through the NASA POWER SSE.

The DIRINDEX Model (Ineichen; Perez et al.)

$$I_n^{DIRINT} = I_n^{DISC} !X(K_t'', Z, w, \# K_t''),$$

where

I_n^{DIRINT} is the DIRINT model output of hourly DNI;

I_n^{DISC} is the output of the DISC (Direct Insolation Simulation Code) model, and is derived by multiplying the DNI at TOA by the atmospheric DNI transmittance which is empirically related to the atmospheric GHI transmittance, or the clearness index;

X is the factor of insolation conditions;

$K_t^!$ is the solar zenith angle-independent clearness index;

Z is the solar zenith angle;

w is the atmospheric column water empirically derived from the surface dew-point temperature;

$\# K_t''$ is the “stability index” which requires the previous and next hourly records in addition to the current hourly record.

$$I_n^{DIRINDEX} = I_{nc}^{SOLIS} \left(I_n^{DIRINT} / I_{nc}^{DIRINT} \right),$$

where

$I_n^{DIRINDEX}$ is the DIRINDEX model output hourly DNI;

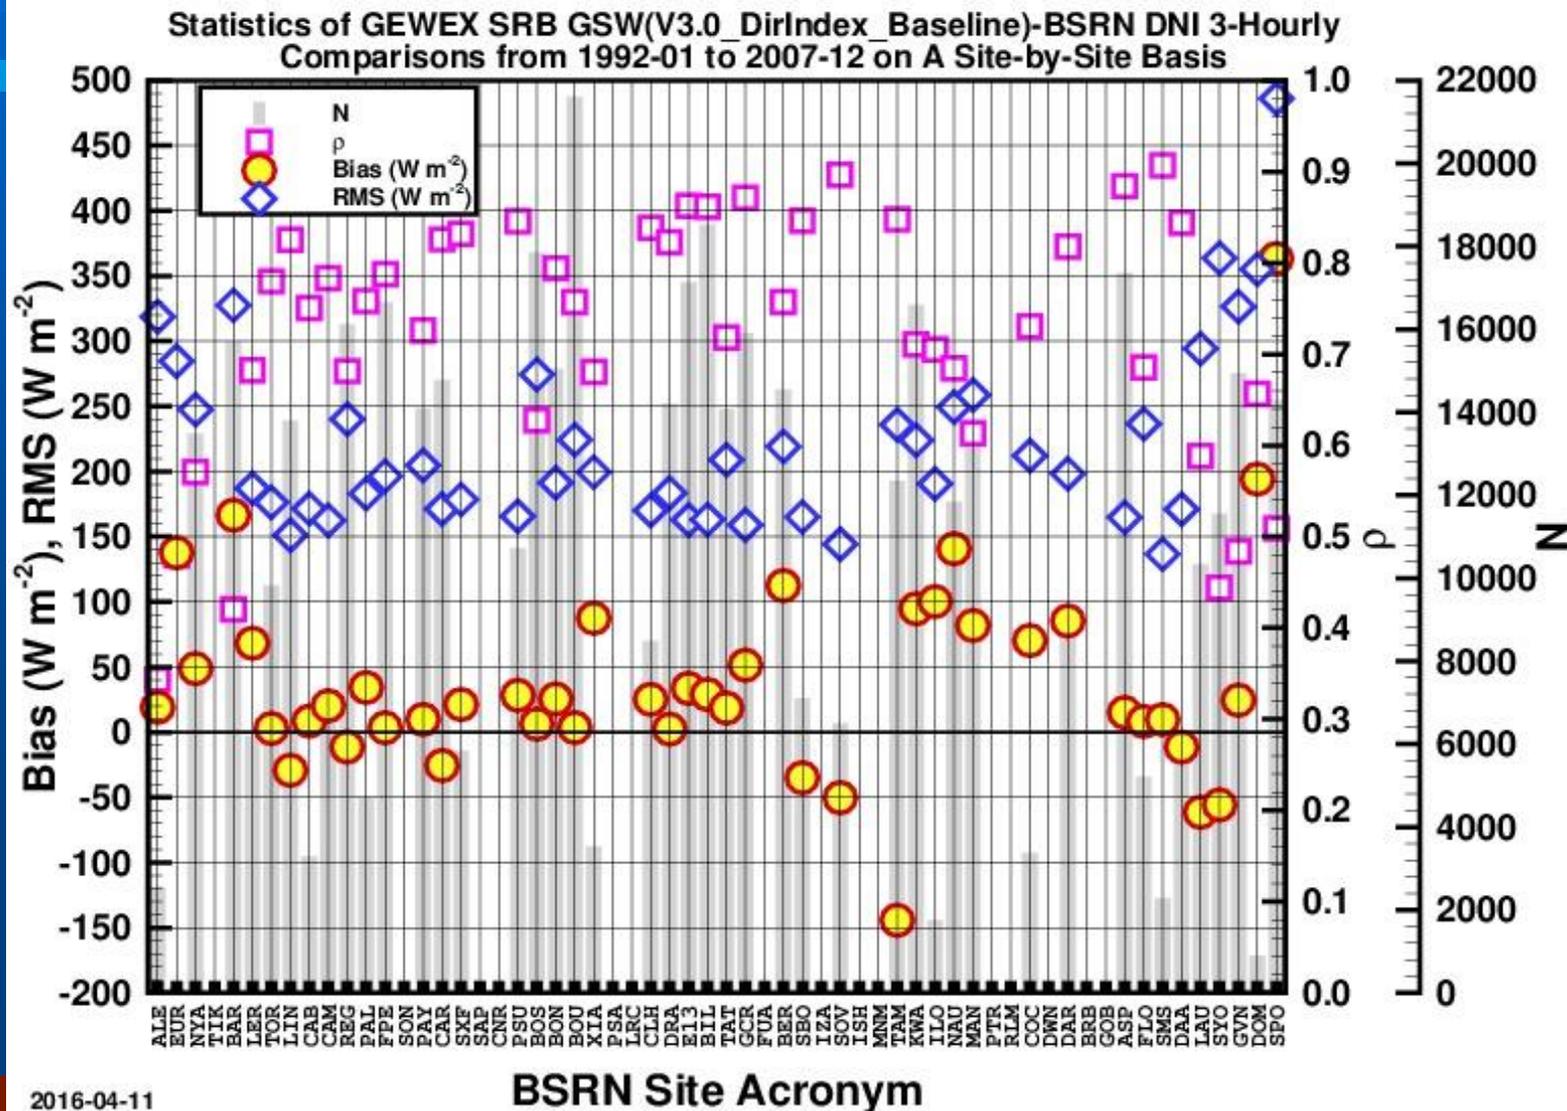

I_{nc}^{SOLIS} is the output DNI from the simplified version of the SOLIS model;

I_n^{DIRINT} and I_{nc}^{DIRINT} are the output of DNI from the DIRINT model under all-sky and clear-sky conditions, respectively.

Conclusions

- As of October 2015, there are 8955 site-months of BSRN data from 60 BSRN sites, including data from SURFRAD sites since July 2009;
- Over the period from 1992 - 2007, the BSRN data used to validate the GEWEX SRB GHI and DNI derived therefrom; and from 2008 - 2015, the BSRN data are used to validate the FLASHFlux data. Therefore, all available BSRN data have been used;
- Sites that show unusual patterns in scatter plots are identified as ALE, BAR, SON, IZA, TAM, ILO, SYO, GVN, and SPO. High altitudes could contribute to the disagreement with SON and IZA, while snow and ice at high latitudes could partly explain the behavior of ALE, BAR, SYO, GVN and SPO;

Conclusions *(Continued ...)*

- In validation of either the GEWEX SRB GHI, or the FLASHFlux GHI, or the model-derived DNI, when 4 sites, albeit not all the same sites, are excluded, comparison statistics show significant improvement;
- Further work is needed to resolve the issues regarding the differences at these sites.

Thank you!
